

Feature Description: Enhanced User Creation Process

Overview

The Origin application has introduced an enhanced user creation process to streamline account setup and improve security. This new implementation modifies the existing workflow to include additional user information and provides a more secure method for password management.

Previous Functionality

In the old user creation process, the admin could create a user account by simply providing an email ID and a password. The admin was responsible for setting up the initial password for the user.

New Implementation

The updated user creation functionality allows the admin to input more comprehensive user information and enhances the security of the password setup process. Key changes include:

1. Expanded User Information:

- The admin can now enter the following details when creating a user account:
 - **Name**
 - **Email ID**
 - **Phone**
 - **Location**
 - **Role**

2. Email-Based Password Setup:

- Once the admin provides the necessary details and save, the Origin application will send an email to the user's email address.
- This email will contain a secure link for the user to set their own password.
- The user will be able to manage their password independently, enhancing security and user experience.

Benefits

- **Improved Security:**
 - By allowing users to set their own passwords through a secure link, the risk associated with sharing initial passwords is eliminated.
 - Users can manage their passwords securely, adhering to best practices.
- **Enhanced User Experience:**
 - Users receive a seamless onboarding experience by setting their own passwords, reducing the complexity and potential security issues involved in password management.
